Ten Years of Transformative Progress in Alzheimer's Dementia Research: From DIAN Insights to AI-Powered Discovery: Alzheimer's Prevention, Aging, and Artificial Intelligence

Randall Bateman M.D.
Charles F. and Joanne Knight Distinguished Professor of Neurology
DIAN and DIAN-TU PI and Director
Washington University School of Medicine

Alzheimer's disease – the challenge

- The most common form of dementia
  - Pathology of loss of synapses and neurons, and amyloid and tau aggregation (specific diagnosis) with other associated proteinopathies
  - Progressive memory loss, decreased judgment, communication challenges, personality changes & confusion
  - Worsens over time until death
  - Has common pathophysiology but may have a variety of pathogenic causes
- ***Alzheimer's is age dependent, regardless if due to dominantly inherited mutations, APP duplication, ApoE4 risk factor or other causes. Why is the disease so age dependent?***
- Alzheimer's disease is a unique disease of humans (unlike cancer, stroke, atherosclerosis, etc.). Why?

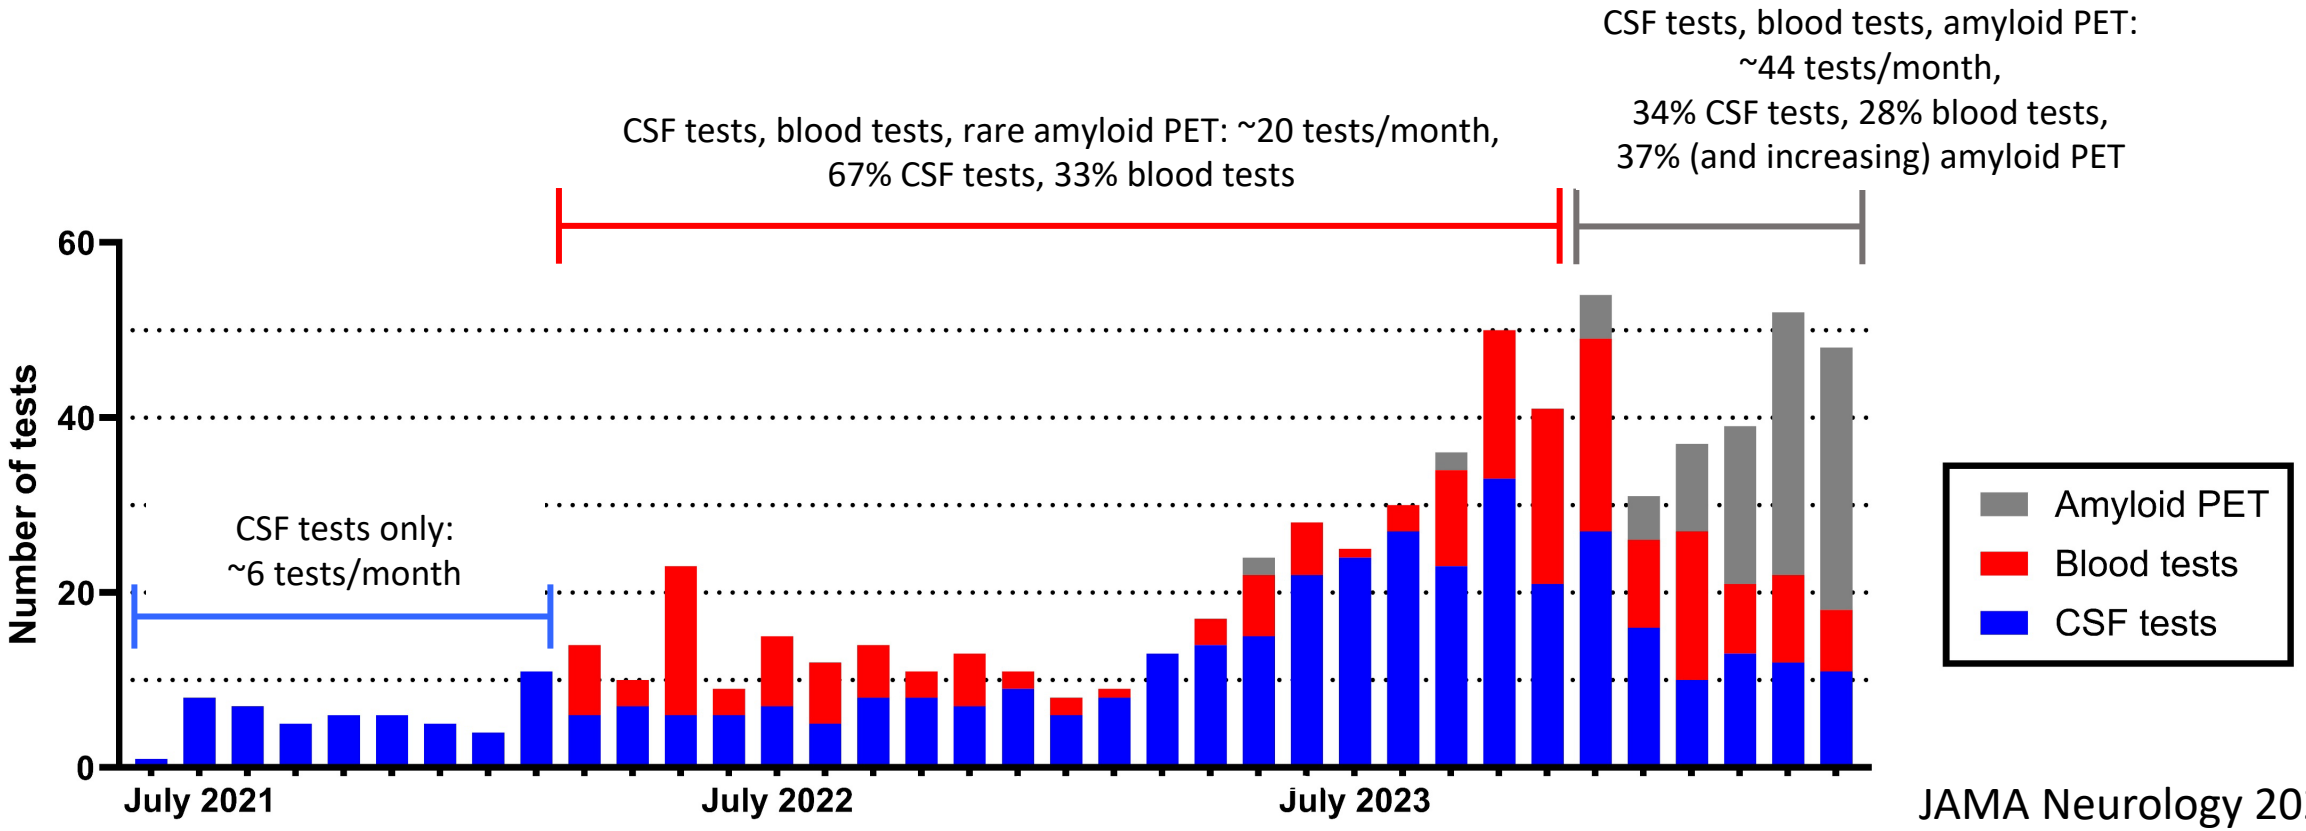
Blood Biomarkers to Detect Alzheimer Disease in Primary Care and Secondary Care

Sebastian Palmqvist, MD, PhD; Pontus Tideman, MSc; Niklas Mattsson-Carlgren, MD, PhD; Suzanne E. Schindler, MD, PhD; Ruben Smith, MD, PhD; Rik Ossenkoppele, PhD; Susanna Calling, MD, PhD; Tim West, PhD; Mark Monane, MD, MBA; Philip B. Verghese, PhD; Joel B. Braunstein, MD, MBA; Kaj Blennow, MD, PhD; Shorena Janelidze, PhD; Erik Stomrud, MD, PhD; Gemma Salvadó, PhD; Oskar Hansson, MD, PhD

	Primary care	Secondary care
Medical history, No./total (%)		
Cardiovascular disease	355/511 (69.5)	337/692 (48.7)
Hyperlipidemia	269/512 (52.5)	230/692 (33.2)
Chronic kidney disease	134/511 (26.2)	117/691 (16.9)
Diabetes	113/512 (22.1)	103/691 (14.9)

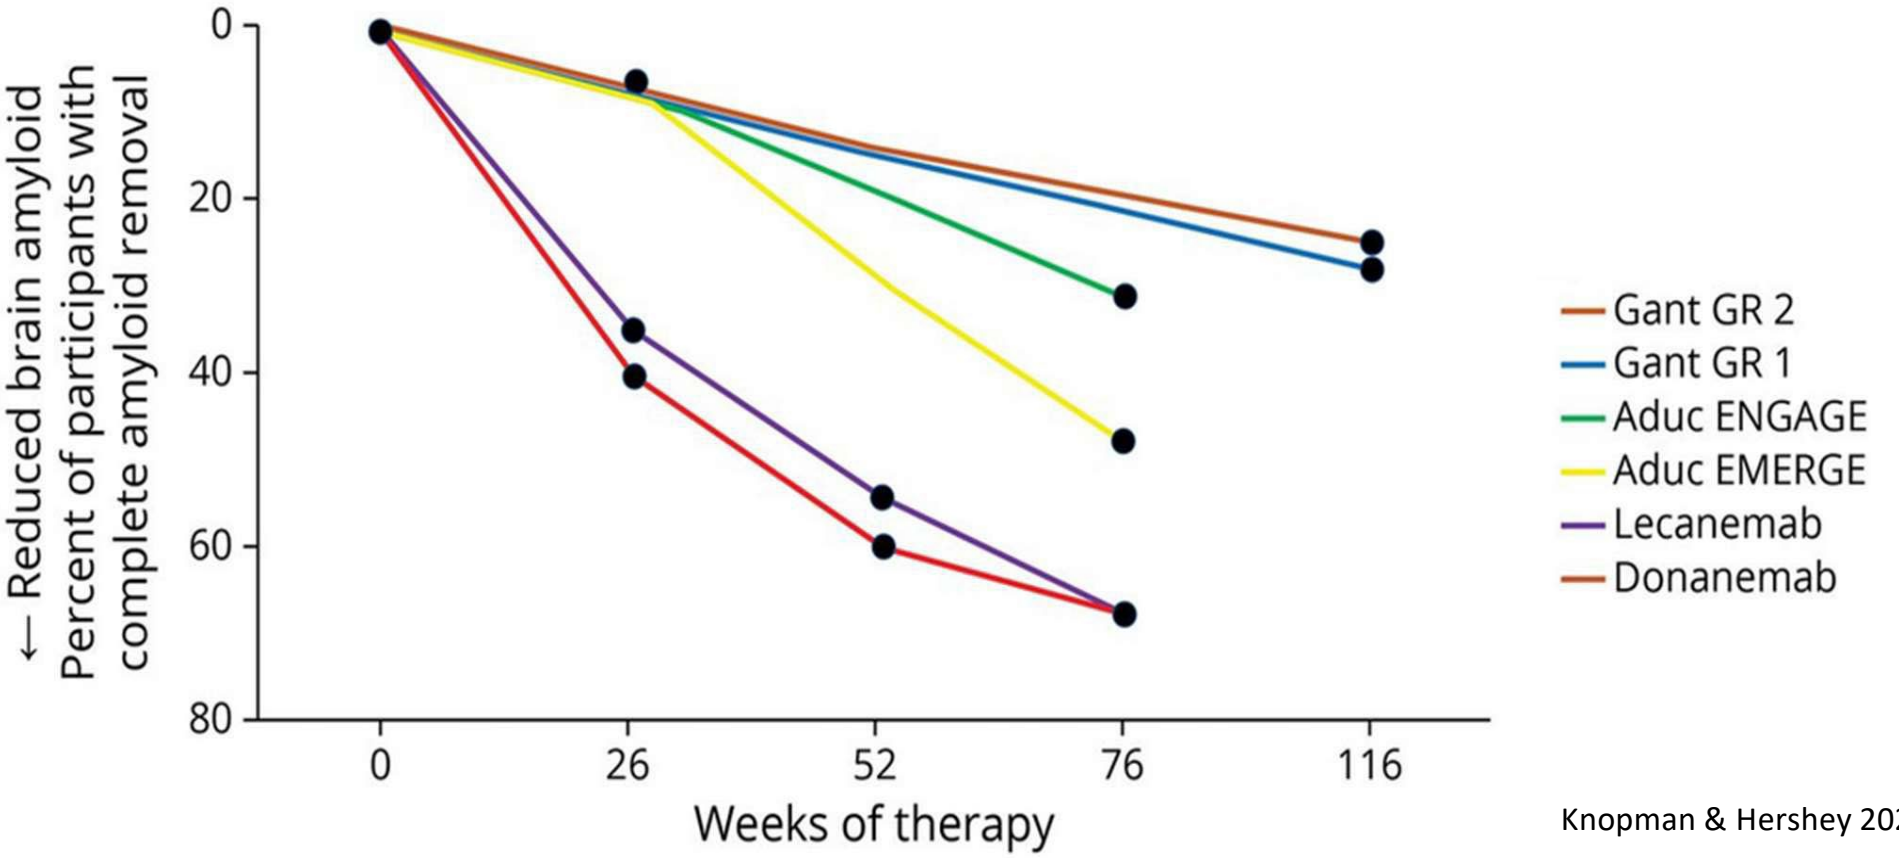
Clinical biomarker testing at Washington University

- Biomarker testing has increased ~7-fold over the past 3 years
- AD blood tests have been used in clinical diagnosis and decision making for >2 years
- The modality used for biomarker testing is greatly affected by practical considerations such as reimbursement



JAMA Neurology 2025

Drugs which completely remove detectable amyloid plaques (by PET scan) have consistently shown less cognitive and clinical decline in mild early Alzheimer's disease



Knopman & Hershey 2023

Advent of disease-modifying treatments for AD

- Lecanemab was the first fully FDA-approved disease modifying treatment for early symptomatic AD
- The CLARITY AD trial demonstrated that lecanemab slowed clinical progression by 27% on the primary endpoint, the Clinical Dementia Rating® Sum of Boxes (CDR®-SB), which measures both cognitive and functional features typically affected by AD

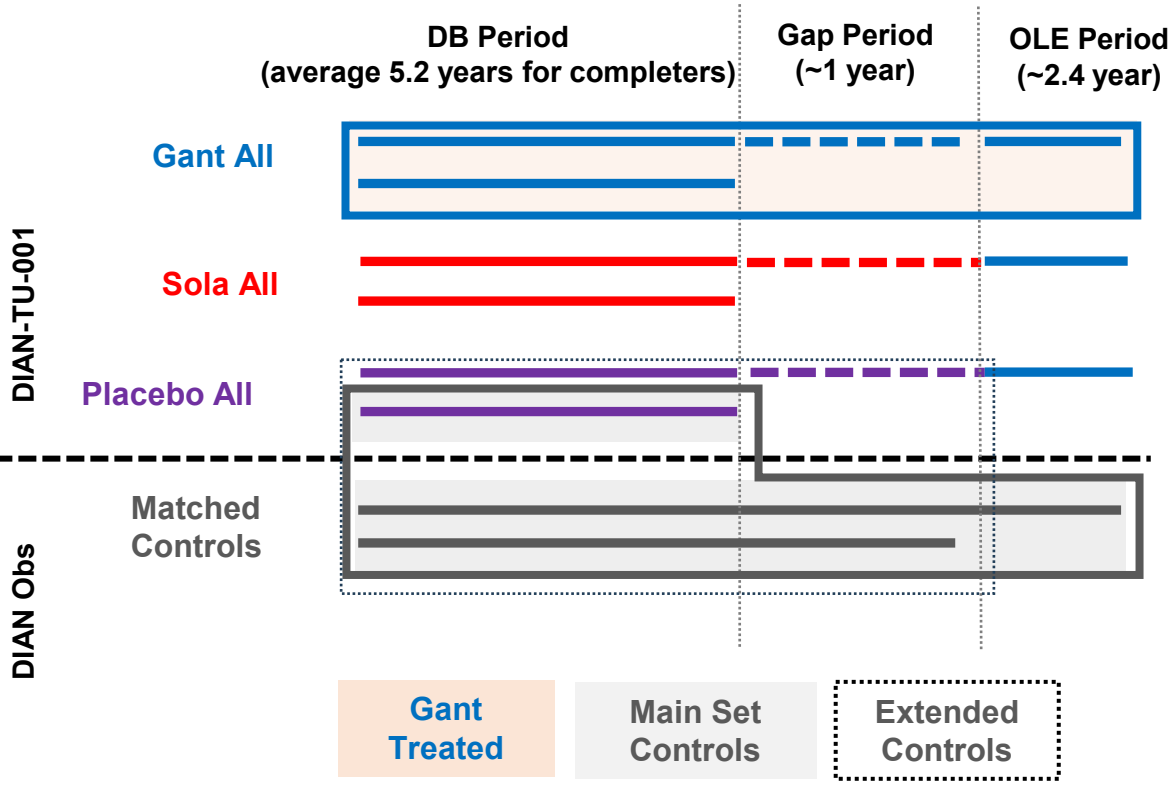
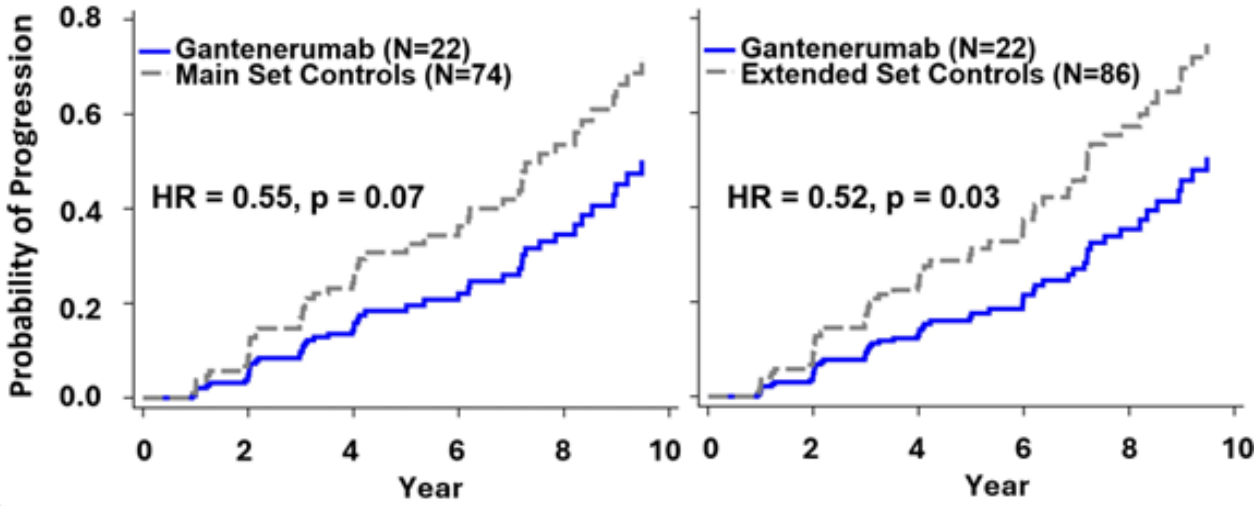
Asymptomatic participants at baseline treated with gantenerumab the longest had delayed symptom onset and probability of progression free compared to controls

KNIGHT FAMILY DIAN TU
Dominantly Inherited Alzheimer Network Trials Unit
DIAN-TU-001 •GANT OLE

Longest Gant Treated



50% reduction in the risk of CDR-SB progression in Longest Gant Treated group



Output based on Cox proportional hazard model

- CDR SB: time to recurrent progression
- Event % is the event rate per person year.
- A hazard ratio (HR) of 0.50 would represent a 50% reduction in the risk of progression in the treatment group compared to the control group.

The DIAN-TU trial of gantenerumab provides the first proof of principle that removing amyloid plaques may prevent the onset of Alzheimer's disease dementia.

Safety and efficacy of long-term gantenerumab treatment in dominantly inherited Alzheimer's disease: an open-label extension of the phase 2/3 multicentre, randomised, double-blind, placebo-controlled platform DIAN-TU trial

DIAN-TU-003: Amyloid Removal Trial (ART)

KNIGHT FAMILY DIAN TU Dominantly Inherited Alzheimer Network Trials Unit
DIAN-TU-003 • ART

Former gantenerumab OLE participants treated with lecanemab open-label for 5 years, to assess long-term efficacy (up to 15 years) and safety of removing amyloid plaques.

In DIAD mutation carriers, ART will determine:

1. Clinical effects of anti-amyloid antibodies on delaying dementia onset and risk of progression in treated compared to non-treated participants
2. Long-term effects of anti-amyloid antibodies on the rate and full removal of amyloid plaques
3. Effects of long-term amyloid plaque removal on

    a) longitudinal measures of established and novel fluid biomarkers of amyloid removal and disease progression

    b) amyloid-related imaging abnormalities (ARIA)

Coming Next: the Amyloid Removal Trial (ART)

KNIGHT FAMILY DIAN TU
Dominantly Inherited Alzheimer Network Trials Unit
DIAN-TU-003 • ART

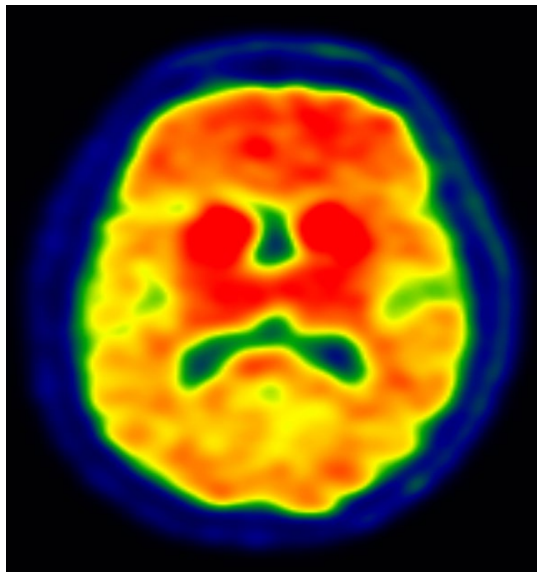
DIAN-TU ART Trial launched in June 2024

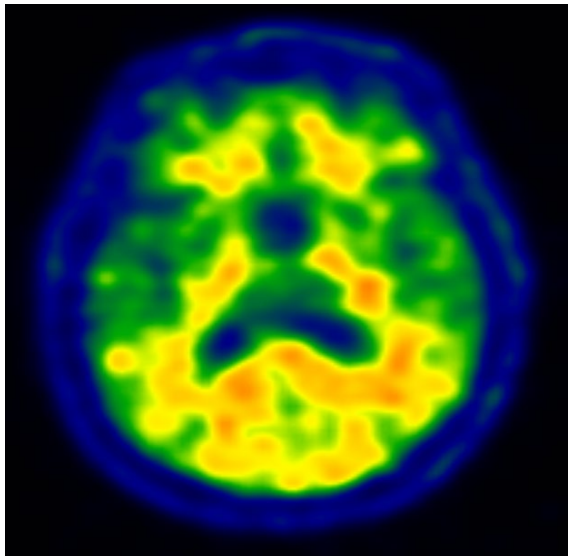
- First participant is co-enrolled in the DIAN-TU ART trial and the DIAN Observational study
  - Participant has received therapeutic dosing.

- DIAN-TU ART trial fully enrolled in Q2 2025
  - Participants will be treated for five years
  - Final results will provide up to 15 years of treated participants with annual evaluations of progress

Historical Precedent: Treatment of inherited high cholesterol with statin to decrease pathology before organ failure

Young familial hyper-cholesterolemia patient with cholesterol deposits resolved after treatment with a statin





Young dominantly inherited Alzheimer's participant, still asymptomatic, CDR 0 treated with gantenerumab to remove amyloid plaques

Pre-treatment

Post-treatment

How will we solve aging causes of Alzheimer's?

- Join forces across labs and fields – bring together fundamental biology of aging research with Alzheimer's disease research
- Develop systems capable of handling immense biological complexity (i.e. aging)
  - Omics
  - Machine Learning
  - Deep Learning – neural nets AI
- Accelerating the rate of biomedical discoveries that lead to human health improvement
  - Create scalable scientific partners through generative AI (e.g. LLMs, knowledge structures, and agentic AI)

What Health Problem Are We Trying To Solve?

Developing an AI Scientific Assistant for Biomedical Research

To ***multiply*** the effectiveness of biomedical research efforts, addressing the challenge of making impactful health advances quickly enough for current patients' benefit.

Initial focus on Alzheimer's disease and neurodegeneration as the Proof of Concept:

Affects **tens of millions globally, urgent need for new strategies**

(1) Expertise in Alzheimer's disease and neurodegeneration

(2) Cross-field support with multiple stakeholders in academia, industry, and government

(3) Large research community

(4) Neuroscientists inherently trained in thinking, reasoning, and intelligence

Core Objectives:

Accelerate & improve **accuracy and future success of hypothesis generation** (e.g., asking the right questions, the killer experiment, elegant design, insight)

Transform experimental design with doubling or tripling success rates of durable findings that lead to impactful human health discoveries

Revolutionize data interpretation (doing analyses not possible with traditional human/computer approaches)

Enable cross-disciplinary collaboration that wouldn't otherwise be possible.

Harnessing Artificial Intelligence to Transform Alzheimer's Disease Research, Nature Medicine 2025

How Is It Done Today? What Are The Limitations Of Present Approaches?

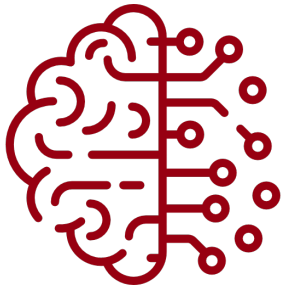
Current limitations:

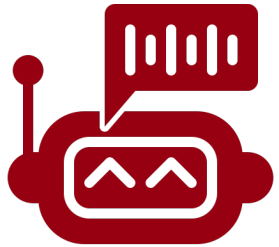
- Several decades required to train new expert scientists
- Too few ground-breaking scientists available for demand/need
- Siloed knowledge limits capacity as information grow at exponential pace
- Researchers limited to increasingly narrow knowledge domains
- Manual literature review and data analysis become less useful
- Breakthroughs and discoveries bottlenecked by available expertise

Data challenges:

- Overwhelming volume of new research, data, and interactions
- Difficulty integrating cross-disciplinary findings
- Inefficient or incorrect utilization of existing knowledge

How will we build and train the AI Biomedical Research Scientist Assistant?





Bring together leaders in academic AI, AI tech industry, biomedical researchers and Pharma in a public-private Consortium

World leading Neurodegenerative and Aging researchers with deep expertise and vast biomedical datasets will design, train, and use AI systems

Establish and grow the Consortium with stakeholders aligned in accelerating basic biomedical discoveries to improve human health and brain aging

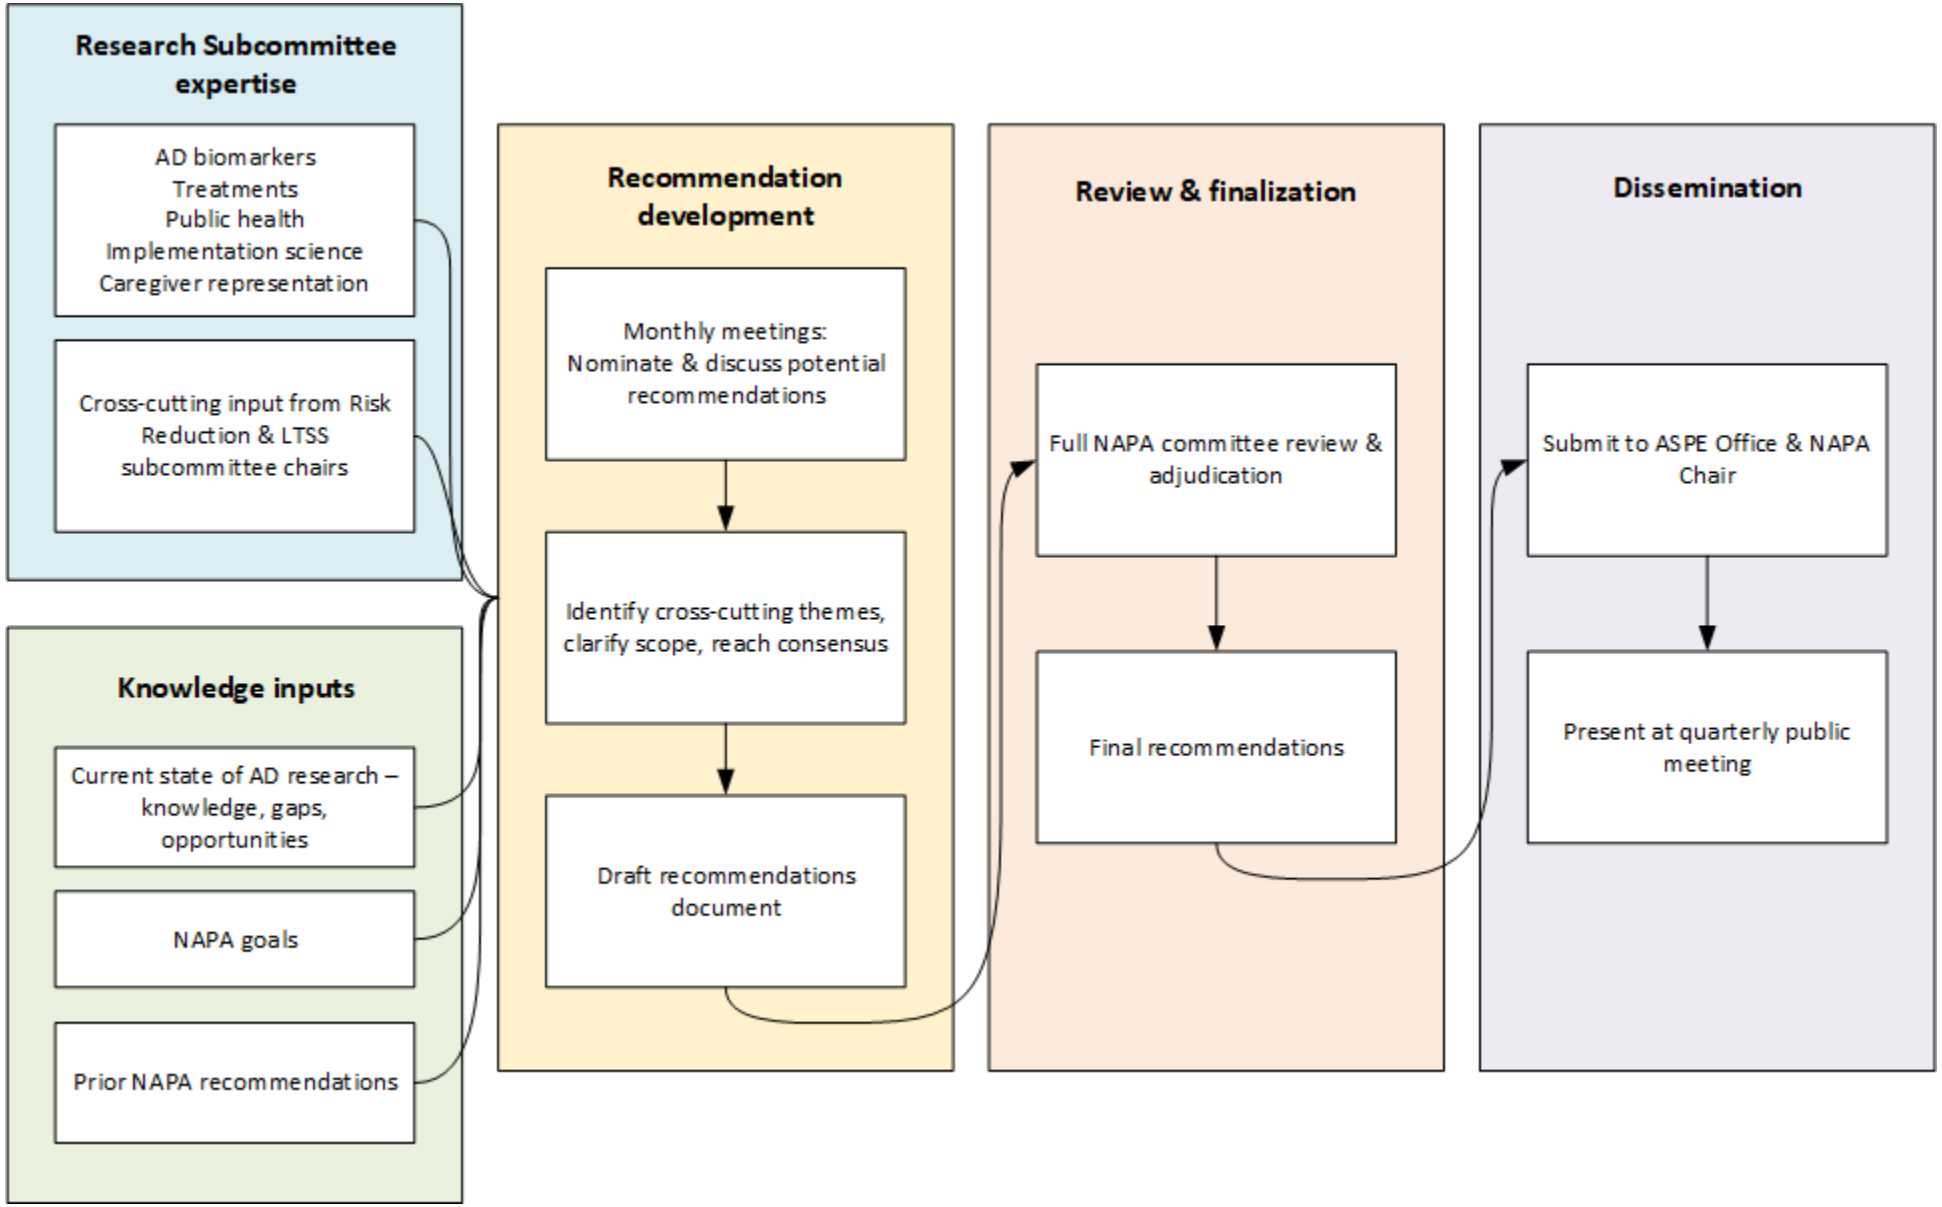
How do research results turn into actionable NAPA recommendations?



NAPA impact

- Recommendations toward NAPA goal of treating and preventing Alzheimer's disease have contributed to increased federal funding for ADRD research
- Multiple breakthroughs in recent years:
  - First disease-modifying treatments for AD
  - Diagnostic tests, including blood tests, being used in the clinic to diagnose patients with 90-95% accuracy
  - Multiple prevention trials launched, with emerging evidence that AD might be prevented years before symptom onset
