

APPENDIX Pc:

**PRESENTATION ENTITLED “ACTUARIAL RESEARCH
CORPORATION’S LONG TERM CARE
INSURANCE MODEL”**

Actuarial Research Corporation's Long Term Care Insurance Model

June 22, 2011

Caveats

- No one can foresee how this program will operate, therefore premiums cannot be guaranteed to be adequate.
 - Unknowns include level of participation, level of antiselection, and the effectiveness of procedures to determine earnings, “actively at work,” and qualifications for benefits, and the effect of providing advocacy services
- Level premiums cannot be determined for benefits linked to an index (CPI), because future benefits are unknown at the time that premiums are calculated.
- Adequacy of premium cannot be guaranteed when premium levels are unknown such as would be the case if premiums bounce up and down with income.

Actuarial Basis For Premium Formula

- For each issue age, projections of benefits, expenses, and premium income are made until age 100 (presumed to be the end of life for all individuals in the cohort).
- The Premium for each issue age is set so that the present value of benefits and expenses is equal to the present value of premium income.

Assumptions

- Premiums are calculated such that there is no subsidy across years of issue or age at issue, as is typical of social insurance.
- Premiums are based on a set of assumptions:
 - Interest Rates
 - Mortality Rates
 - Lapse Rates
 - Expense Levels
 - Utilization Rates

Source for Assumptions

- All assumptions may be modified by the user.
- Interest rates and mortality rates are taken from the 2011 OASDI Trustees Reports.
- Lapse Rates are assumed to be 0.75% per year.
- Premium load for expenses is assumed to be 3%.
- Utilization comes from survey data with several adjustments.

Mortality Assumptions

- 2011 Trustees Report
- Mortality rates decline by roughly 0.8% per year
- Compared to 1994 GAM:
 - Male GAM rates are about 99% of TR rates in 2011
 - Male TR rates go below 1994 GAM in 2012
 - Female GAM rates are about 83% of TR rates in 2011
 - Female TR rates go below 1994 GAM in 2033

Utilization Assumptions:

Data Sources for Nursing Home Rates

- For NH prevalence rates, incidence rates, average length of stay, and continuance table: 1985 National Nursing Home Surveys (NNHS), trended to 2004 NNHS (generally about 20% to 40% reduction depending on age and sex).

Utilization Assumptions:

Data Sources for Home Care Rates

- For HC ages 65+, incidence rates, average length of episode, and continuance table: 1982-1989 National Long-Term Care Surveys (NLTCs) as analyzed by Eric Stallard and Bob Yee, trended to 2004 by change in prevalence rates from the 1989 to 2004 NLTCs (generally about 20% to 50% increase depending on age and sex).
- For HC ages <65, home care prevalence rates from the 2009 National Health Interview Survey (NHIS). Average length of episode is extrapolated from the over 65 (increased by 1% for each age, which is from about 3 1/2 years at age 65 to about 5 3/4 years at age 18). Continuance table is from the over 65. Incidence rates are derived from the formula:
 - $PR = IR * ALOS$, which is equivalent to $IR = PR / ALOS$

Utilization Assumptions: Comparison of ARC Model Incidence Rates to SOA Data for 2+ ADLs

Age	ARC Model (before adjustments)*	SOA 2004 Intercompany Data	Ratio
45	.155%	.13%	1.2
55	.235%	.14%	1.7
67	2.20%	.47%	4.7
77	7.54%	2.81%	2.7
87	21.90%	9.62%	2.3

* Excluded adjustments are for selection, antiselection, trend, and ADL creep. Incidence rates are the sum of NH + HC incidence rates average of male and female.

Utilization Assumptions: Adjustments

- Utilization data are tabulated by age, gender, and ADL.
- Utilization of the under 65 are also tabulated by income level and definition of cognitive impairment.
- We assume that 25% of those with one ADL less than the requirement will receive benefits.
- We calculate the number of new beneficiaries in the first year of benefit payments (2017) by using prevalence rates rather than incidence rates.

Utilization Assumptions: Selection and Antiselection

- Selection: Provisions that result in participants being healthier than average (average is based on survey data for the whole population).
 - The 3-year work requirement
 - NHIS data shows that ADL level of those that work (\$1+ per year \$1) have significantly lower utilization than the total population
- Antiselection: Those in need of services are the most likely to participate in an unsubsidized / voluntary program.

Utilization Assumptions: Selection

- Selection Factor: incidence rates in the last year of required work = 60% of ultimate
 - Work is required for 3 out of the 5-year vesting period
- Selection wears off over 10-year period

Utilization Assumptions:

Antiselection – Two Methods

- Antiselection Factor (AF) – We model two different methods (and other methods are possible):
 - Formula based on a comparison of participation rates and prevalence rates
 - Estimate of additional 1st-year claims
- Additional First Year Claims

Formula Method of Antiselection

- A function of the participation rates and prevalence rates, assumed to diminish over a 20-year period.
- Starts by first calculating a factor that represents the maximum amount of antiselection and then dampens this factor.
- Maximum factor = $1/\text{prevalence rate}$, if prevalence > participation.
- Maximum factor = $1/(\text{prevalence} / \text{participation})$, if participation > prevalence.
- Different factor at each age and sex

Utilization Assumptions: Antiselection - Examples

- Example 1 - Male age 35 2+ ADLs: participation = 0.81% & prevalence rates = 0.13%
 - $AF = 1/.0081 = 124$ (perfect antiselection)
 - $AF = 100^{0.7} = 29.2$ (imperfect antiselection)
 - $AF(5) = 12.8$ (interpolated value at duration 5)
- Example 2 - Male age 55: participation = 3.43%, prevalence = 0.24%
 - $AF = 1/.034 = 29.2$ (perfect antiselection)
 - $AF = 29.2^{0.7} = 10.6$ (imperfect antiselection)
 - $AF(5) = 6.0$ (interpolated value at duration 5)

Additional First Year Claims

Method of Antiselection

- Tabulate NHIS number of individuals that meet criteria for participation and benefit eligibility.
- Assume that they all receive benefits in 2017 possible.
- * All = Dementia, developmental disabilities, mental retardation, ADD, schizophrenia, bipolar.
- ** SRD = 1st 3 in list above

Income	All* Cognitive or 2+ ADLs (ooo)	All* Cognitive or 3+ ADLs (ooo)	SRD** Cognitive or 2+ ADLs (ooo)	SRD** Cognitive or 3+ ADLs (ooo)
\$0+	2,651	2,005	1,865	1,589
\$1+	623	571	480	428
\$10k+	412	374	315	277

Policy Options That Can Be Modeled

- Earnings requirement (parameter in law)
 - Years of work required (3)
 - Level for participation (quarter of coverage = \$1,090 in 2009)
 - Level for subsidy (poverty line = \$10,830 in 2009)
- Benefit trigger (ADL requirement)
- Dollars per day of benefit including indexing options
- Indexing of premium
- Waiver of premium while in claim status
 - While in nursing home
 - And / or while in home care
- Deductible period
- Lifetime maximum

Assumptions That Can Be Modified

- Strength of antiselection
- Level of utilization
- Trend in utilization
- Lapse
- Interest
- Expense load
- Level of mortality
- Trend in mortality

Premium Sensitivity

- Final set of assumptions for calculating premiums have not yet been determined.
- Premiums are very sensitive to some assumptions:
 - Low Income Subsidy / Income requirements
 - Participation rates (1% to 4% decreases premiums by 13% to 18%)
 - Indexing of premium (20+% reduction in initial premium)
 - Interest (14% increase in premium for 4.7% interest vs 5.7% interest with no change in CPI)
 - Lapse (8% increase in premium for 0% lapse from 0.75%)
 - Trends in mortality (4.3% decrease in premium by changing annual trend from 0.75% to 0.25%) and morbidity

A REPORT ON THE ACTUARIAL, MARKETING, AND LEGAL ANALYSES OF THE CLASS PROGRAM
